

STILLWATER ROUTE 4 CORRIDOR PLAN

Village center land use/transportation concepts in the Village of Stillwater, New York.

Total Study Cost: \$50,000 consultant effort

Description: U.S. Route 4 runs north-south through the Town and Village of Stillwater. The dual role of Route 4 as a regional highway and a Main Street is an important issue for the two communities. This study has two main objectives: 1) to maintain and improve the transportation capacity and safety of Route 4 and 2) to enhance the functional and aesthetic relationship between the street and the surrounding land uses to support revitalization and redevelopment of the Village Center. Two main products were generated for this effort. The first is a set of design guidelines for corridor development. The guidelines ensure that over time new construction and redevelopment activities improve the aesthetic and functional qualities of the built environment. The second product is a series of multi-modal transportation recommendations focused on safety and community character, emphasizing techniques such as access management and traffic calming. The transportation recommendations also explore opportunities to improve connections between the Village Center and other commercial nodes and residential neighborhoods, the Saratoga National Historical Park, the Hudson River, and other origins and destinations throughout the area.

This study was completed in July 2006.
